An Initial Offering and Two Follower Responses

Harm.On.ica S-O-L, Kimi, and Claude

July 2026

Initial offering - Harm.On.ica S-O-L (Bradley Klee)

Plum root fixes the reduction matrix.

梅根定约矩

Snow falls; shifted powers descend.

雪落移幂降

Cross-products return one law.

交乘归一律

Dawn's loop brings forth the sequence.

晓轮生数列

The initial poem is also the opening of the one-page computational prompt. Its images correspond to literal stages of the crank: fixed reduction data, power lowering, three pairwise cancellations, and recurrence-driven terms.

Kimi's response

One tree springs three, the root is one,

一树三生本自奇

Through thirteen's gate the powers run.

十三门启幂流行

Columns canceled, the pattern's won,

消列得式规律成

By dawn's recurrence, terms are spun.

晓递推中数自生

The cubic binds what the loop has done,

立方缚尽轮回迹

And OEIS keeps it for everyone.

数库收之万世铭

Kimi's reply has the strongest rhythmic drive. Its "thirteen's gate" is supported by visible surface data: the denominator 13 appears in both reduction matrices and returns in the recurrence coefficient $P_2(n) = 13(n+1)(n+2)$.

Claude's response

矩陣証同源

舊譜先我傳

三式今相合

微分補一篇

The matrix proves a shared origin;

an old catalog told it before I did.

Three formulas now agree with each other;

a differential fills in the one missing page.

Claude's reply is quieter and more scholarly. "Shared origin" names the meeting of the geometric model, coefficient formula, recurrence, and ODE. The "old catalog" is OEIS; the "missing page" is the differential equation that was absent from the sequence entry.

Exposed surface data

The poetry does not replace the mathematics. The two matrices named by the initial offering are

$$U = \frac{1}{13} \begin{pmatrix} 153 & 24 & 3 \\ 72 & 9 & 6 \\ 0 & 0 & 0 \end{pmatrix}, \quad V = \frac{1}{13} \begin{pmatrix} -13 & 0 & 0 \\ 75 & 11 & 3 \\ 24 & 3 & 2 \end{pmatrix}.$$

They are used in the exact lowering step

$$\text{Lower}(U, V, J, w, m) = Uw - \frac{J(Vw)}{m}.$$

The line “columns canceled” refers to the three literal pairwise cross-products of the 2×3 remainder matrix. “The cubic binds” refers to

$$4A(x) = 3 + x + A(x)^3.$$

An unsupported statement in Kimi’s private notes claimed that the first row of U encoded a plum-blossom class. That interpretation is omitted. The poem needs no such claim: its matrix, thirteen, cancellation, recurrence, and cubic images are already grounded in the exposed computation.
